五年後の Control Enabler

成田丞

mindtools@mac.com

ControlEnabler?

- ~ 5年程前に発表した
- ~ 名前は成田が勝手に付けた
- ~ UIパーツの更新をする
- ∼ Cocoa Bindingと同じ目的の別機構

UIの更新の既存の手法

- ~ 手書き
- Cocoa Binding
- NSUserInterfaceValidations

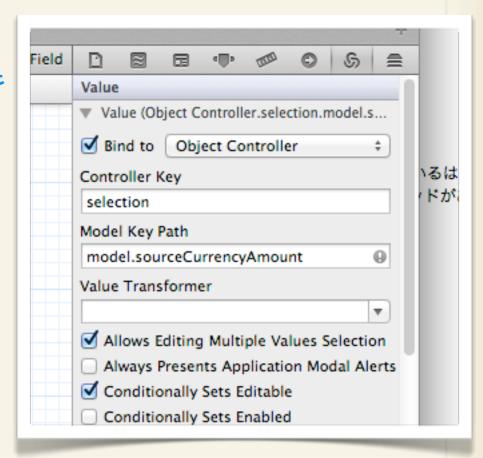

手書き

```
@interface CCAppDelegate : NSObject
@property (assign) IBOutlet NSTextField *rateField;
@end
@implementation CCAppDelegate
- (void) update
  [self.rateField setStringValue:@"this is Update."];
@end
```

Cocoa Binding

```
@interface CCAppDelegate : NSObject
    .
    .
    @property (retain) CCModel *model;
    .
    .
    dend

@implementation CCAppDelegate
    .
    .
@end
```

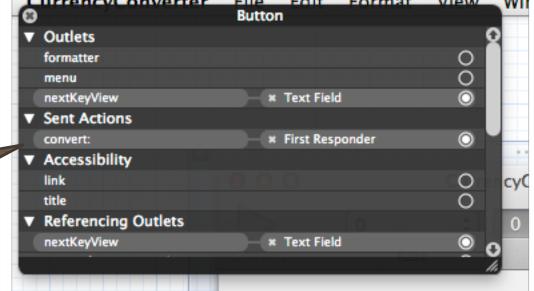

NSUserInterfaceValidation

```
@interface CCAppDelegate : NSObject
-(IBAction)convert:(id)sender;
@end

@implementation CCAppDelegate
-(BOOL)validateUserInterfaceItem(id<NSValidatedUserInterfaceItem>)anItem
{
    if( [anItem action] == @selector(convert:) )
    {
        if( 動作条件 ) return YES;
    }
    return NO;
}
```

ターゲットを自動で探して くれるのが利点

@end

NSUserInterfaceValidationの注意事項

- ∼ NSMenuは自動でUpdate
- ∼ NSToolbarItemも自動でUpdate
- ~ NSControlは手動で validateUserInterfaceItemを呼出す

ControlEnabler/1?

特徵

- ∼ NSUserInterfaceValidationの方式を拡張
- ~ MenuやToolBarだけでなくControlも自動で更新
- ~ 設定でなくメソッド名の規約を定める

ControlEnabler

```
@interface CCAppDelegate : NSObject
-(IBAction)convert:(id)sender;
@end
                                    メソッド名を
@implementation CCAppDelegate
- (BOOL) canConvert: (id) sender
                                    "can<action名>:"とする
   return YES or NO;
 (NSString*) titleOfConvert:(id<NSValidatedUserInterfaceItem>)anItem
   if( [self canConvert:anItem]
       return @"Convert";
                                     メソッド名を
   else
       return @"Don't convert";
                                     "titleOf<action名>:"とする
@end
```

メソッド名と機能

Actionメソッド名: "action:"

action:を呼出すコントロールのenable/disableは

- (BOOL) canAction:(id)sender

action:を呼出すコントロールのstate(On/Off等)は

- (NSIntger) stateOfAction:(id)sender

メソッド名と機能

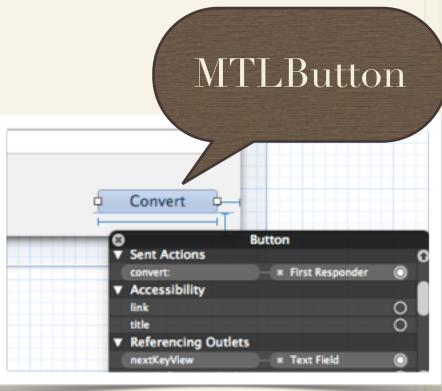

機能	メソッド名	返値の型
enable/disable	can <action>:</action>	BOOL
状態	stateOf <action>:</action>	NSCellStateValue
画像	imageOf <action>:</action>	NSImage
タイトル	titleOf <action>:</action>	NSString
物によって違う	stringValueOf <action>:</action>	NSString
toolTipの内容	toolTipOf <action>:</action>	NSString

コード例

- Button Denable/disable
- ~ Toolbar@enable/disable
- Menu@enable/disable
- ~ Menuの選択
- ~ ラジオボタンの選択
- ~ セグメントコントロールの選択

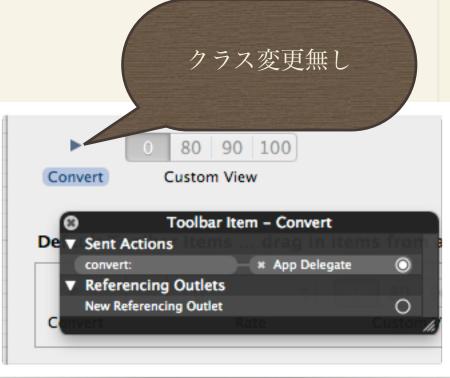

Button Denable/disable

```
@interface CCAppDelegate : NSObject
-(IBAction)convert:(id)sender;
@end
@implementation CCAppDelegate
- (BOOL) canConvert: (id) sender
{
    return YES or NO;
- (BOOL) validateUserInterfaceItem: (id
<NSValidatedUserInterfaceItem>*)anItem
   return [self controlItemEnabler:anItem];
@end
```

Toolbar@enable/disable

```
@interface CCAppDelegate : NSObject
-(IBAction)convert:(id)sender;
@end
@implementation CCAppDelegate
- (BOOL) canConvert: (id) sender
{
   return YES or NO;
- (BOOL) validateUserInterfaceItem: (id
<NSValidatedUserInterfaceItem>*)anItem
   return [self controlItemEnabler:anItem];
@end
```

Menu@enable/disable

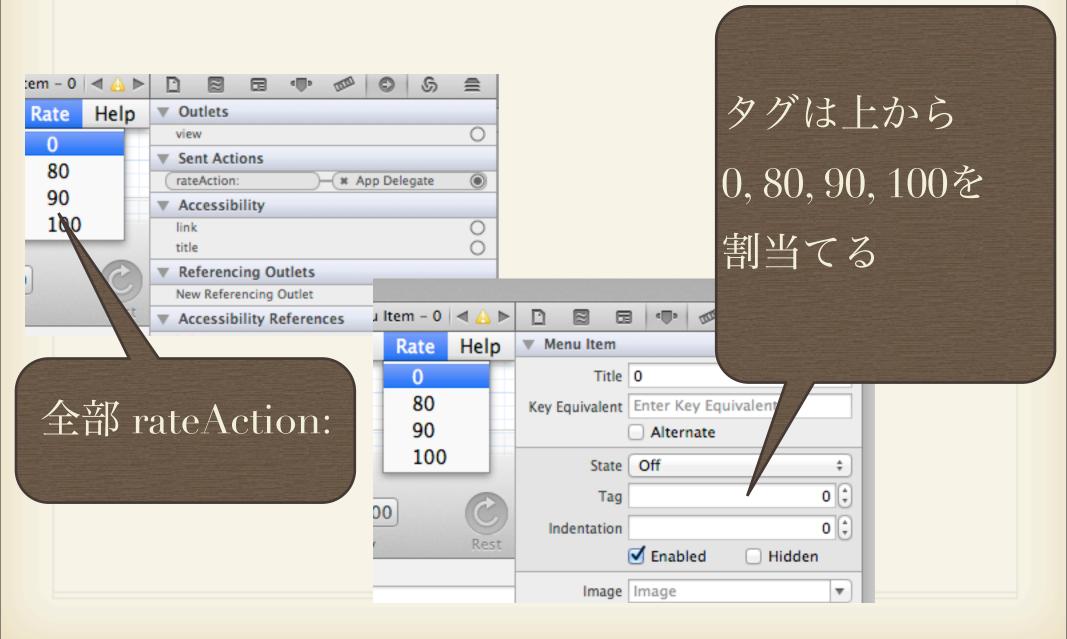

```
@interface CCAppDelegate : NSObject
-(IBAction)convert:(id)sender;
@end
@implementation CCAppDelegate
- (BOOL) canConvert: (id) sender
                                         Rest
{
    return YES or NO;
- (BOOL) validateUserInterfaceItem: (id
<NSValidatedUserInterfaceItem>*)anItem
   return [self controlItemEnabler:anItem];
@end
```

Menuの選択

```
@interface CCAppDelegate : NSObject
-(IBAction)rateAction:(id)sender;
@end
@implementation CCAppDelegate
-(IBAction)rateAction:(id)sender
    self.model.rate = [sender selectedTag];
}
- (NSInteger) stateOfRateAction:(id<NSValidatedUserInterfaceItem,
MTLControlItemEnablerProtocol>) anItem
    if( self.model.rate == [anItem selectedTag] )
     return NSOnState;
    else
      return NSOffState;
- (BOOL) validateUserInterfaceItem:...略
@end
```

Menuの選択

ラジオボタンの選択

```
@interface CCAppDelegate : NSObject
-(IBAction)rateAction:(id)sender;
@end
@implementation CCAppDelegate
-(IBAction)rateAction:(id)sender
    self.model.rate = [sender selectedTag];
}
- (NSInteger) stateOfRateAction:(id<NSValidatedUserInterfaceItem,
MTLControlItemEnablerProtocol>) anItem
    if( self.model.rate == [anItem selectedTag] )
     return NSOnState;
    else
      return NSOffState;
- (BOOL) validateUserInterfaceItem:....略
@end
```

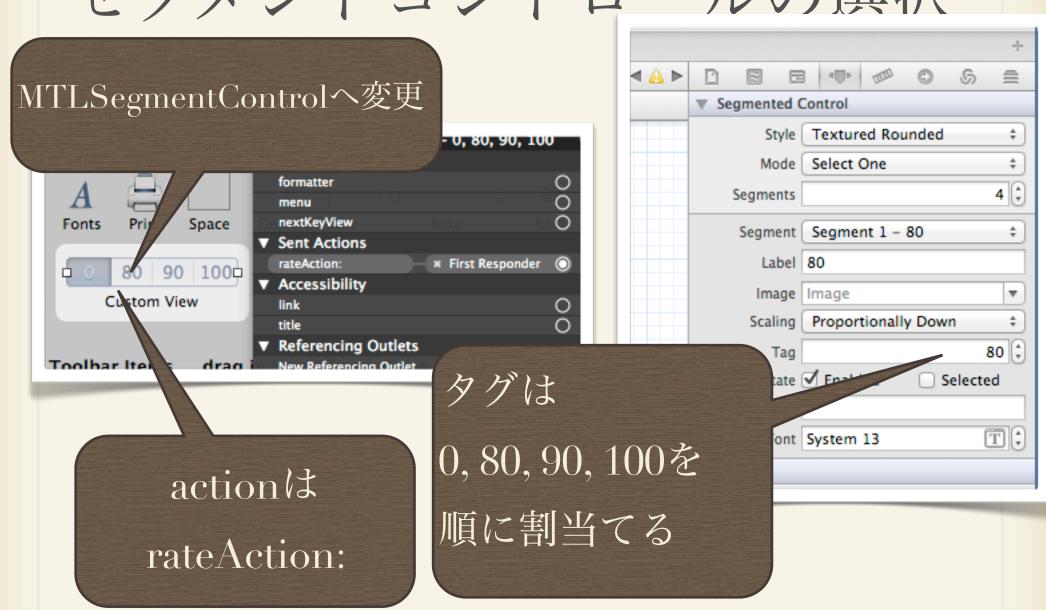

ラジオボタンの選択

セグメントコントロールの選択

```
@interface CCAppDelegate : NSObject
-(IBAction)rateAction:(id)sender;
@end
@implementation CCAppDelegate
-(IBAction)rateAction:(id)sender
    self.model.rate = [sender selectedTag];
}
- (NSInteger) stateOfRateAction:(id<NSValidatedUserInterfaceItem,
MTLControlItemEnablerProtocol>) anItem
    if( self.model.rate == [anItem selectedTag] )
     return NSOnState;
    else
      return NSOffState;
- (BOOL) validateUserInterfaceItem:....略
@end
```

セグメントコントロールの選択

利点と欠点

ControlEnablerの利点

- ∼ actionメソッドの近くに制御内容が書ける
 - ~ 宣言的に表記出来る
- ~ targetがnilでもOKなので疎結合
 - ~ nibの分轄時に楽
- ∼ bindingよりIB上の操作が楽(かも)

ControlEnablerの欠点

- ~ 規約に適合したメソッド名を正確に書か なければならない
- ~ target-actionを持たないNSViewには対応 出来ない
- ~ bindingと共存出来ないかもしれない
- ~ 成田が飽きるとライブラリ更新が止まる
